

A rectangular metal box with two slots on the top, an electrical cable with a plug, two dials and two levers that slide up and down at the same end of the metal box and on the side. Into the slots are input two pieces of bread. The levers are then slid down manually. At which point elements inside the metal box automatically heat up and warm the bread. After a length of time, determined by the position of the dials on the metal box, the levers return to the up position automatically and the bread is pushed out of the slots and now appears toasted.
